0 1	Some alkanes can be burned and used as fuels. A way to represent the complete combustion of an alkane fuel is shown by the following word equation.								
	alka	ie +	+ 0)	kygen	$\longrightarrow$	compoun	dx+	water	
0 1 . 1	Name compour	d x.							[1 mark]
	Hexane is an example of an alkane that can be burned as a fuel. One reaction of hexane burning in air is shown below.								
	2C6⊦	14 <b>-</b>	+ 1:	3 <b>0</b> 2 –	$\rightarrow$	12CO	+	14H <sub>2</sub> 0	
0 1 . 2	Name the carbo	n comp	ound pro	oduced ir	n this re	eaction.			[1 mark]
0 1 . 3	Suggest a reaso	n for thi	is carboı	n compo	und be	ing produ	ıced.		[1 mark]
0 2	The table shows the elements that are present in a sample of crude oil. These elements can also be present in the fractions produced from this sample crude oil.								
		Eler	nent	% of e	each el	ement			

1

Element	% of each element				
Carbon	85				
	14				
Sulfur	0.5				
Nitrogen	0.5				

Name the missing element.

[1 mark]

.....

1

**Note:** To answer the exam-style question below you will also need to know some of the material covered in the <u>atmospheric pollutants</u> videos.

When fractions from crude oil are burned in air, new compounds are made. These compounds can sometimes cause pollution.

0 3 . 1

Describe how burning fractions from crude oil can cause pollution. Use the table to help you.

In your answer you should name the compounds produced.
